Abstract

This template is designed for academic papers that benefit from a modular structure. The main file stays lightweight, the preamble is centralized, and each major section can be drafted independently in its own chapter file.

1 Introduction

This template is built for academic writing projects that benefit from clean separation between presentation and content. The top-level document remains short, the shared formatting lives in the preamble, and each section can be revised independently.

The modular structure is especially useful when a paper starts to accumulate figures, tables, appendices, and repeated formatting choices. It also makes collaboration easier because coauthors can work on different sections without editing one very large file.

In practice, most papers need only a few stable ingredients: a consistent preamble, section-wise files, a bibliography, and predictable build commands. This template packages those pieces into a reusable starting point. For methodological guidance, see classic references such as Angrist and Pischke [2001] and Wooldridge [2010].

2 Background

A good paper template should reduce friction rather than create it. That usually means making the common path easy: drafting text, adding references, inserting tables, and extending the appendix as the project grows.

This version keeps a conventional academic article structure while cleaning up typography and visual defaults. The body text remains appropriate for long-form reading, but tables use a more legible sans-serif style to avoid the cramped feel that older serif table fonts sometimes create.

3 Data and Descriptive Structure

This section is a natural place to summarize datasets, sampling, variable construction, or institutional detail.

Table 1: Example Summary Table

Variable	Control	Treatment
Mean outcome	0.42	0.57
Standard deviation	0.18	0.21
Observations	1,240	1,255

Notes: Replace this table with your own descriptive statistics or summary output.

4 Empirical Strategy

This section can house identification arguments, estimating equations, assumptions, and specification details.

A standard baseline specification might be:

$$y_{it} = \alpha + \beta x_{it} + \gamma_t + \delta_i + \varepsilon_{it}. \tag{1}$$

Here, γ_t denotes time fixed effects and δ_i denotes unit fixed effects. The estimating equation is intentionally simple in the template so it can be adapted quickly.

5 Results

The results section is often where document organization starts to matter most. Tables, figures, robustness checks, and interpretation can make a paper feel cluttered unless the structure is clear.

Replace with a figure, event-study plot, conceptual diagram, or coefficient chart.

Figure 1: Example Figure Placeholder

When writing up findings, it usually helps to separate three tasks: reporting the core estimate, explaining magnitudes, and discussing interpretation or limitations.

6 Conclusion

This template is meant to be a sturdy default rather than a highly customized final style. It should be easy to copy into a new project, adapt quickly, and extend with appendices, tables, and references as the paper evolves.

In most workflows, the biggest gains come from consistency: using the same structure across projects makes drafting, revising, and sharing much easier.

A Appendix

Appendices can hold additional tables, robustness checks, extended proofs, survey instruments, or supplementary figures.

- Add extra results here.
- Keep large supporting material out of the main text when possible.
- Extend the modular structure as the project grows.
